

Star Force Base 1198 — Deployment Runbook

Star Force Base 1198 — Deployment Runbook

Production deployment guide for the React (Vite) + Convex application. Canonical domain: <https://starforcebase1198.com> (already baked into sitemap.xml, robots.txt, manifest.webmanifest, and the email SITE_URL default).

1. Architecture

The frontend is a pure static build: no Node server required at runtime. Every dynamic feature (auth, data, uploads, webhooks) is served by Convex.

2. Production build & checks (all verified ves on this branch)

```
bun run build # tsc -b && vite build && build:isolate -> passes
bun test # 26 tests, 0 fail
bun convex dev --once # backend codegen + typecheck
```

- Build out
 - No localh
 - Known (r
- (harmless)
- (see src/m

3. EMAIL_FROM default already matches the verified domain.

Seed data (optional, one-time)

Run `seed:seedDemo` with `{"clear": true}` from the Convex dashboard Functions tab, or `npx convex run seed:seedDemo '{"clear": true}'` — loads stories, lore, missions (with briefings), groups, forum threads, demo users and an operator account.

6. Post-deploy checklist

- [] Sign-up -> magic-link email arrives (Freebuff OTP relay works out of the box; Resend key powers story/support verdicts)
- [] Membership checkout completes and tier upgrades (webhook granted) + cancellation reverts to Free
- [] /missions, report-in, and /operator/reports review flow works on the live domain
- [] `https://starforcebase1198.com/sitemap.xml` and `/robots.txt` resolve
- [] System Health shows no new red items (backup provider remains a known placeholder)
- [] Error monitoring (VITE_VLY_APP_ID / VITE_VLY_MONITORING_URL) reporting to Freebuff
